

AGILE Press Release on American Designed and Manufactured

AGILE, www.aisinterop.com, a leading provider of interoperable communications solutions that enable public and private organizations to achieve seamless connectivity in the most challenging environments has reaffirmed that all components and designs of emergency communications equipment are American Made.

AGILE has reaffirmed and certified that all components of each and every AGILE designed and manufactured communications products, as they always have been, are fully designed and produced in the USA and Germany.

As concerns have been raised from various commercial and government entities on the vulnerability and inability to source necessary components to support emergency communications, such as: circuit boards, antennas, GPS tracking and IP, in order to ensure that they are not compromised. AGILE stands by our policy of only utilizing American ingenuity and technology to insure the security of our capabilities.

All AGILE technologies are built to be mobile and tough, not static — each is an extension of the company's flagship product, **CORE** (Common Operating Radio Engine). **CORE** integrates Landline, Cellular, Radio, Wi-Fi and SATCOM in a portable, rugged enclosure supporting incident response and command and control functions for interoperability and unified incident command systems and provides secure communications between multiple parties, agencies, vehicles and IoT enabled devices under the harshest of circumstances.

All AGILE technologies are an extension of its flagship product, **CORE** (Common Operating Radio Engine). AGILE **CORE** technologies have proven themselves on the field under the harshest of circumstances around the globe with users such as the World Health Organization (WHO) and Doctors Without Borders and are now being deployed by US municipalities and the federal government.

All AGILE **CORE** products are Band 14 capable, ready to support the FirstNet network.

For more information about AGILE communications solutions and its full line of land-based and marine-based technologies, please contact Annie Hong at annie@aisinterop.com.
